

Data Boot Camp  
Lesson 2.2

**Today, this is you.**

# Refresher

What does “coding requires thinking procedurally” mean?

# How a Computer Thinks (Procedurally)

Often, problems in software development begin with complex and abstract real-world needs.

# How a Computer Thinks (Procedurally)

---

In order for a computer to interpret things, a real-world problem must be broken down into a set of procedural steps.

## Complex Real-World Problem

# How Code Is Written (Procedurally)

## Code (JavaScript)

```
1  // STEP 1
2  // -----
3  var thingamagig = 500;
4  var doodad = 200;
5
6  // STEP 2
7  // -----
8  var combinedThing = thingamagig + doodad
9
10 // STEP 3
11 // -----
12 runContraption(combinedThing);
13
14 // STEP 4
15 // -----
16 resetContraption();
```

What are the four fundamental tools of programming?

# Fundamental Tools of Programming

---

These structures are found in nearly all programming languages:

Conditionals

Iterations

Functions

Variables / Arrays

# Variables: The Nouns of Code

---

- **Variables** are effectively the items in a procedure.
- They can be **physical things** (like an ingredient) or **abstractions** (like a counter).
- In VBA, items can be **declared** as variables by using **dim** followed by a type. Then they can be **assigned** a value.

## Variable Declaration

```
dim ing1 as String
dim ing2 as String
dim budget as Double
```

## Variable Assignment

```
ing1 = "Peanut Butter"
ing1 = "Jelly"
budget = 5.00
```

# Array: A Collection of Items

---

Arrays are effectively **groups** of related items. They are another way to store and reference similar pieces of information.

Item 0

Item 1

Item 2

["Peanut Butter",	"Jelly",	"Bread"]
-------------------	----------	----------

```
dim ingredients(0 to 2) as String
```

```
ingredients(0) = "Peanut Butter"
```

```
ingredients(1) = "Jelly"
```

```
ingredients(2) = "Bread"
```

# Conditionals: If This, Then That

**Conditionals** can control the flow of logic based on certain conditions being met.

Most programming languages use **if/else** code for this purpose.

# Iteration: Round and Round We Go!

**Iteration** is the concept of using loops to perform a group of tasks repeatedly a number of times.

Almost all programming languages use **for loops** and **while loops** for iteration.

# Functions: When One Block Can't Do It All!

**Functions** are, in essence, a sort of sub-process. They allow us to create premade, reusable blocks of code that can be called on demand.

**Main Process**

**Sub-Processes**

Let's Get Coding!
